wishly.

PROJECT HANDOVER

Everything you need to pick up Wishly.

What it is, what it looks like, what's built, what's only a demo, and what to do next. Written for someone starting with no background.

Prepared by Neha
29 October 2026

The code
github.com/nehahypergro/wishly-app

"Sunday pancakes, and the first one always burns. Ten years in, it's still my favorite turn."

EXAMPLE LYRIC · THE APP'S WELCOME SCREEN

01 · THE PRODUCT

Personal songs, made from the memories that matter.

Someone tells Wishly about a person they love: their name, a nickname, a small daily ritual, a moment they remember. Wishly writes and sings a song about that person. The buyer listens and checks every name and fact *before* the song is given, then sends a private link. The person receiving it opens it on the web, with no app and no account.

1

Tell us one memory

The nickname, the joke, the Sunday ritual. One detail is enough to start.

2

We write and sing it

A full song of about 2½–3 minutes, ready in 3 days (or next day with Express).

3

You listen, check, then give

Fix any name or fact first. Then send a private link they can open anywhere.

Anniversary · **Birthday** · **Wedding** · **Mother's Day** · **Father's Day** · **Christmas** · **Milestone** · **Remembrance** · **Just because**

THE OFFER

$59

per song · no subscription

- One correction round included
- Standard: ready in 3 days. Express: next day, +$25
- Extras: photo film +$19, lyric artwork +$12, short share video +$9
- A private listening page with the buyer's message

LAUNCH MARKET

United States only, in US English and US dollars. Songs in English or Spanish. Content for India and other markets is already written and switched off for now.

A complete app you can click through. Nothing behind it yet.

Every screen of the iPhone app is designed and built, and it runs as a self-contained demo. There is no backend, no payment and no App Store build yet, and it has never been run on a real iPhone.

✓ Built and checked

- iPhone app: every screen, from welcome to giving the song
- Recipient gift page on the web
- iOS-style motion, haptics, Liquid Glass, Reduce Motion
- US-only setup, with other markets kept for later
- Type-check, lint and Expo’s health check (20/20) all pass
- Code on GitHub, with notes for Claude in `CLAUDE.md`

~ Demo stand-ins

- Orders are saved on the phone, not on a server
- Apple, Google and email sign-in are simulated
- Lyrics come from a built-in template
- The “song” is a music-box loop, not a recording
- Checkout takes no payment
- “Demo only” buttons finish songs and corrections

– Not started

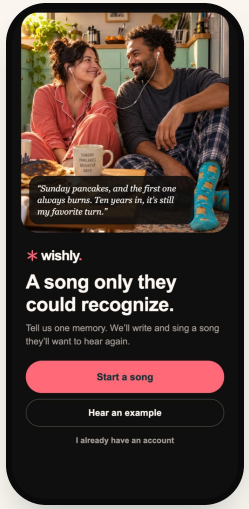

- Connecting the Base44 backend
- Making real songs: vocals and recording
- Payments
- Hosting the web app, so gift links work
- App Store builds: no bundle ID or build settings yet
- Testing on a real iPhone

From one memory to a song they open.

Eight steps in the iPhone app for the buyer, then one on the web for the person receiving it.

THE BUYER · IPHONE APP

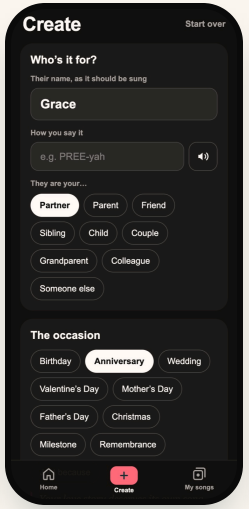

RECIPIENT · WEB

1

Welcome

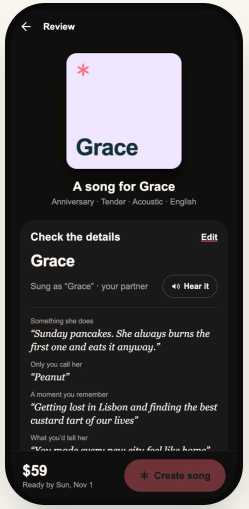

First launch only.

2

Create

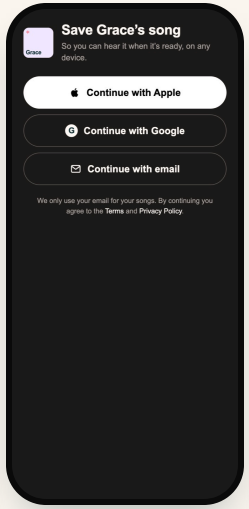

Who, occasion, story, sound.

3

Review

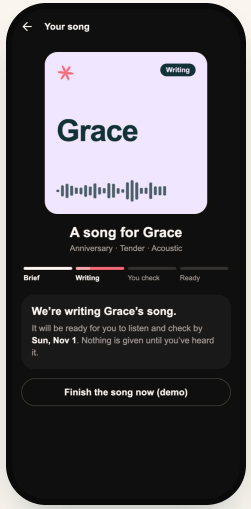

Check details, choose extras.

4

Sign in

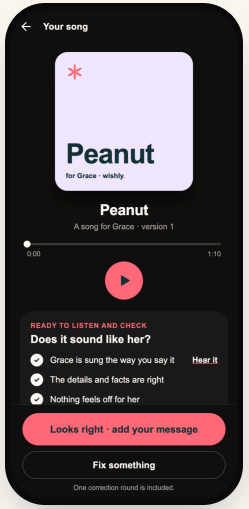

Only now. Apple, Google, email.

5

Writing

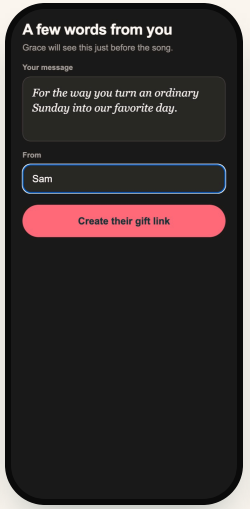

Up to 3 days.

6

Listen and check

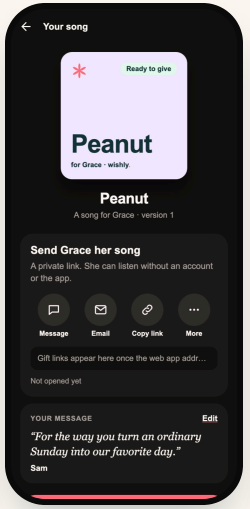

Or ask for one fix.

7

Add a message

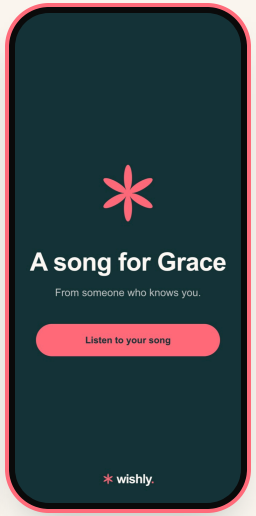

Creates the gift link.

8

Send it

Text, email or link.

9

They open it

In any browser. No app.

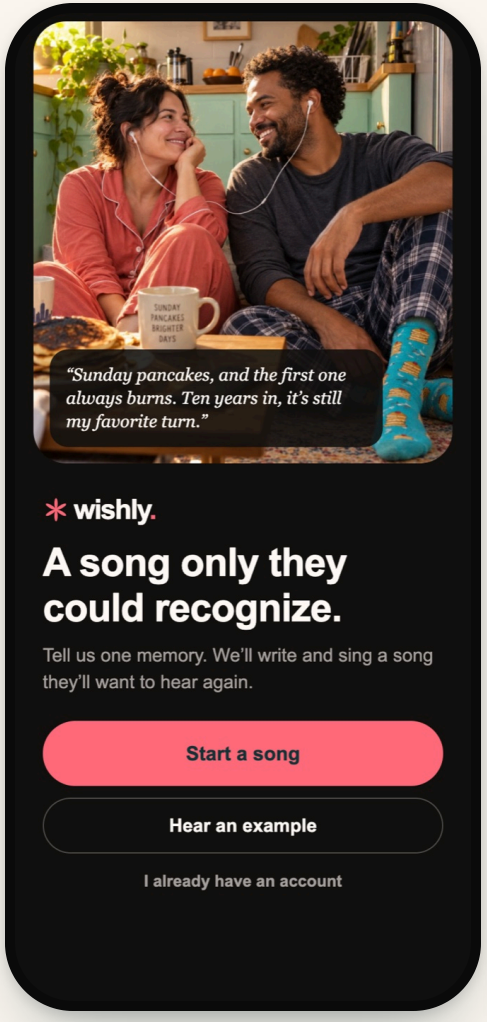

04 · THE APP

First launch and Home

People can look around, play example songs and write a whole song before they’re asked for an account.

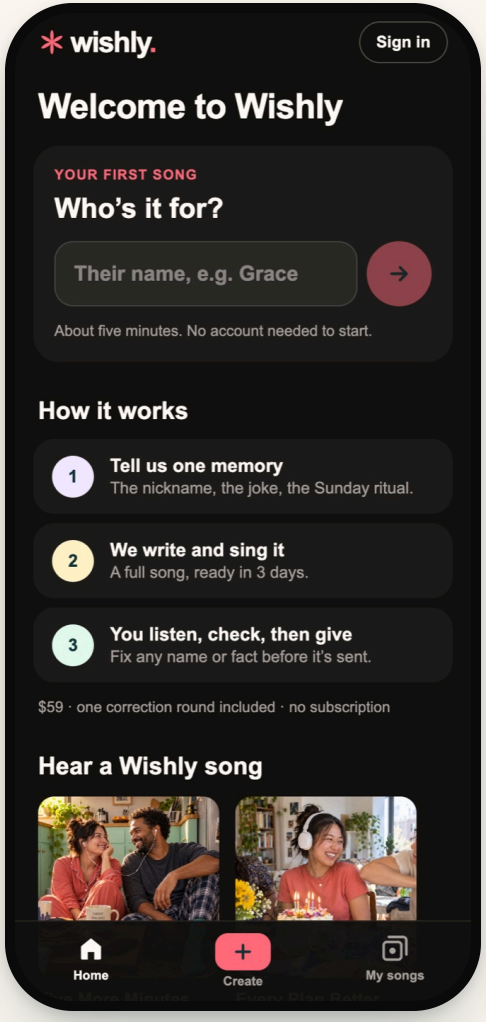

No account wall

Sign-in is asked once, when they tap “Create song” on Review. Keep it that way.

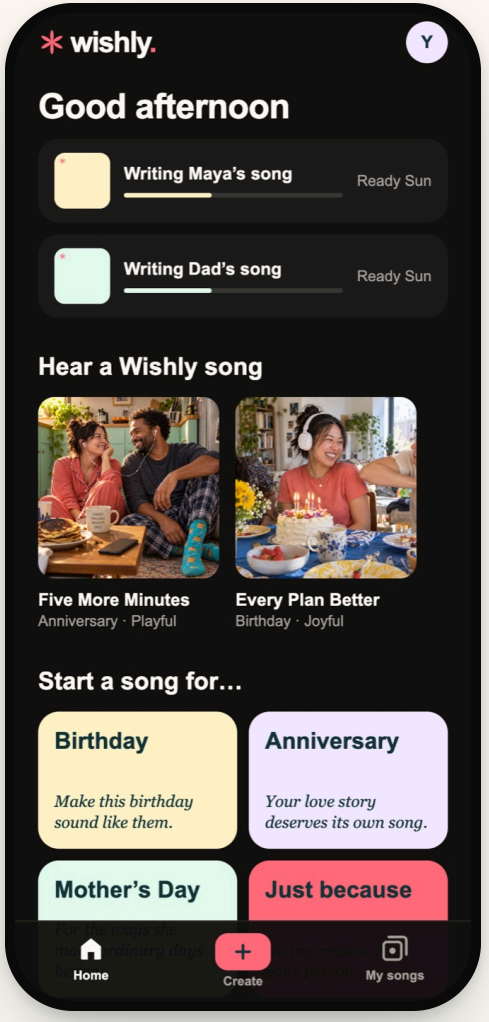

Welcome

Shown once. One photo, one promise, three ways in.

Home, first visit

“Who’s it for?” starts a song from a name. Then how it works and example songs.

Home, later

Songs in progress at the top, then examples and occasions.

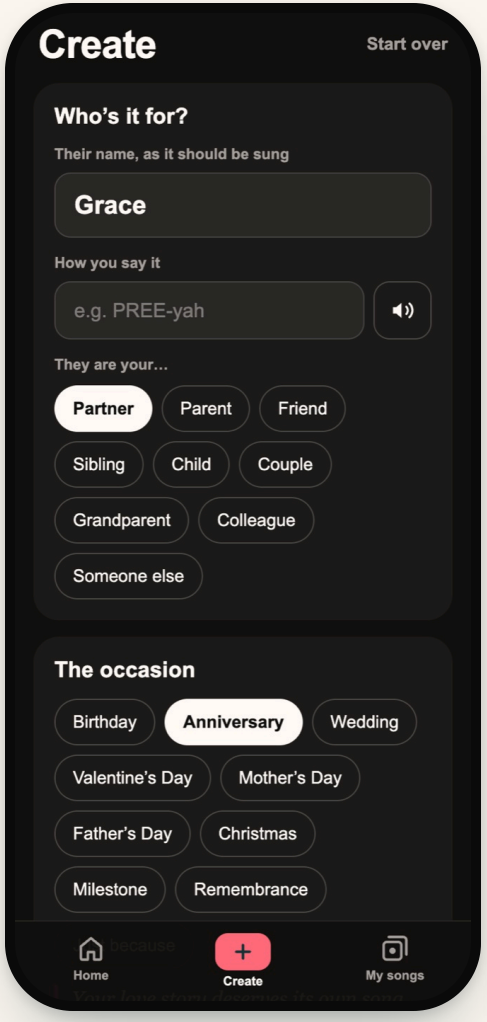

04 · THE APP

Create: the whole song on one screen

The buyer fills in four parts, top to bottom. The button at the end lists anything still missing.

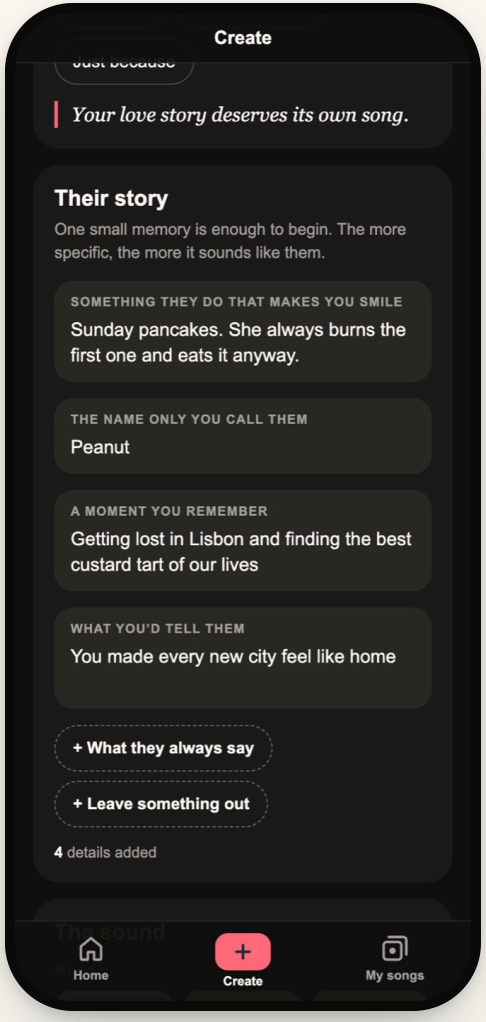

Saved as they go

What they've written is kept on the phone, so leaving the screen or closing the app never loses it.

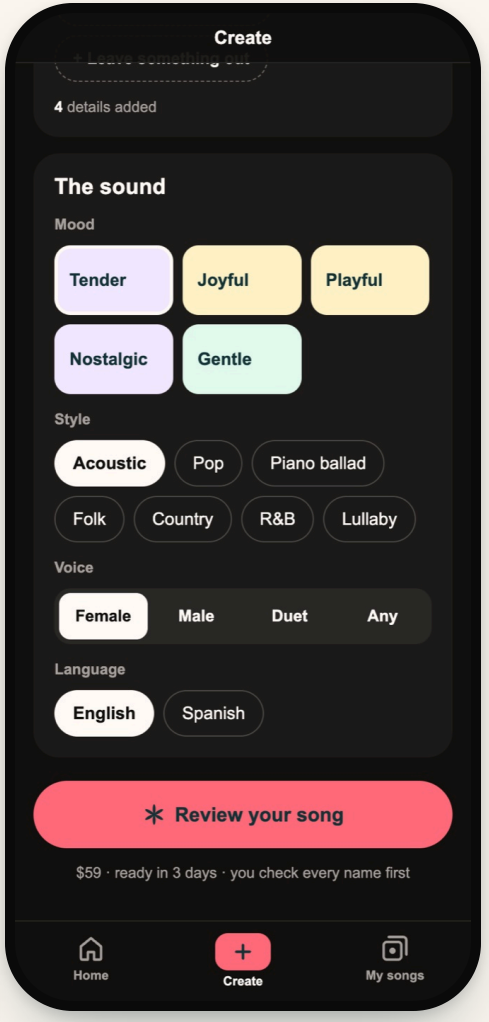

Who it's for and the occasion

The name as it should be sung, how to say it (with playback) and who they are to you.

Their story

One detail is enough. Prompts add a habit, a saying, a nickname, a moment, what you'd tell them.

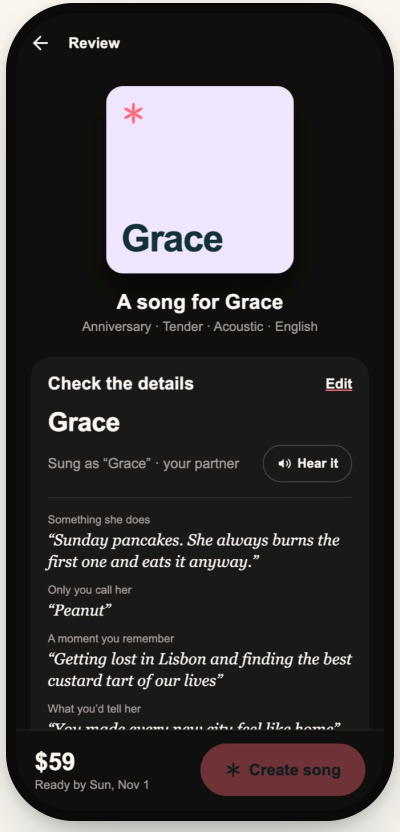

The sound

Mood, style, voice and language. Each mood has its own colour.

04 · THE APP

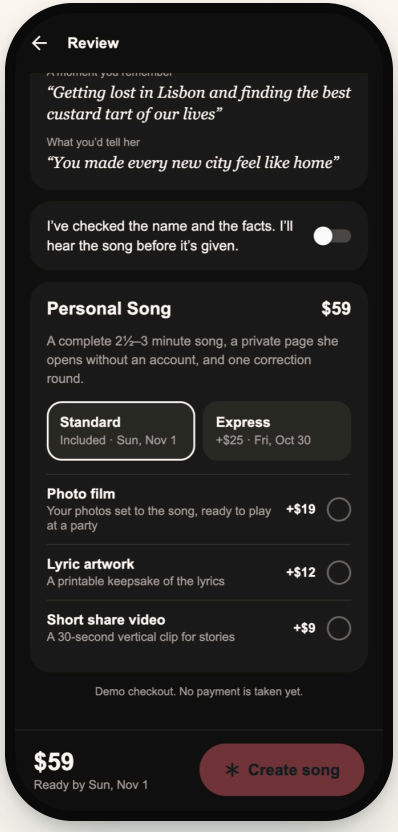

Review and sign-in

The buyer checks every detail, picks delivery and extras, then signs in to place the order.

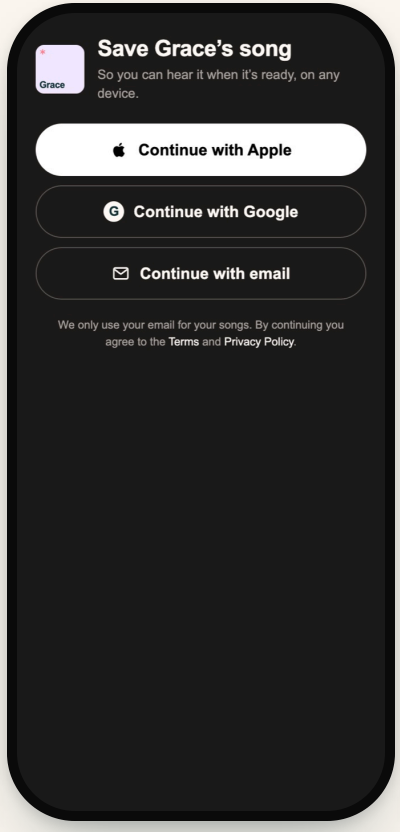

Review

The cover, each detail to check, and “Hear it” for the name.

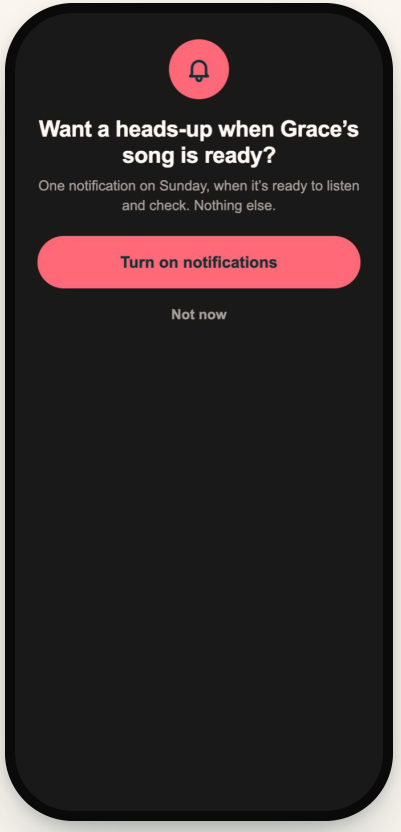

Delivery and extras

$59, Standard or Express, three optional extras.

Sign in

Apple, Google or email with a 6-digit code. A sheet over Review on iPhone.

Notifications

Asked once, right after the first order.

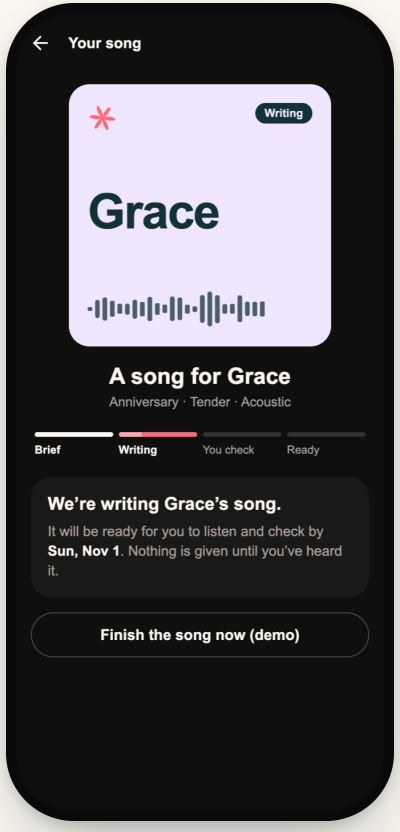

No payment yet

Checkout is a demo. Check Apple’s rules for selling digital goods before choosing Stripe or in-app purchase.

04 · THE APP

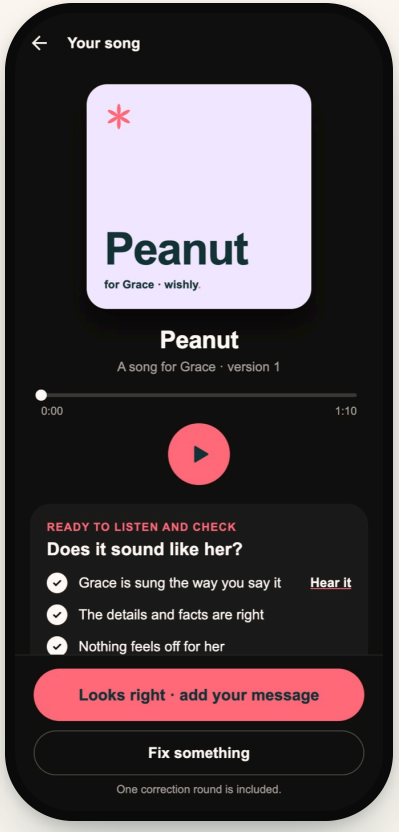

The song, from writing to ready

One screen per song that changes as it moves along. Nothing is given until the buyer has heard it.

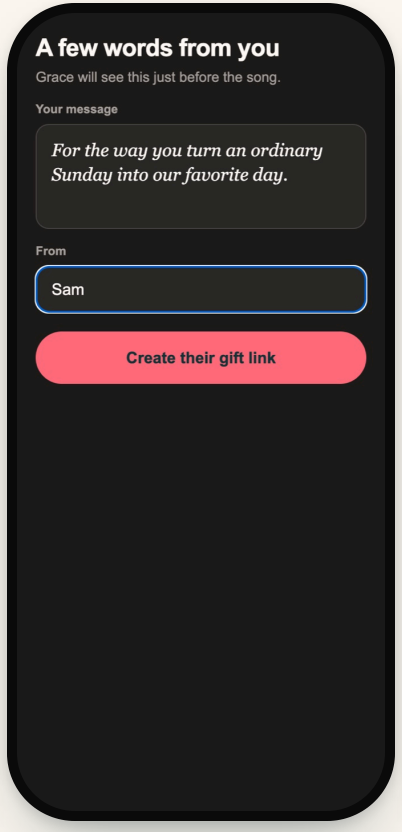

Writing

Progress steps and the date it will be ready.

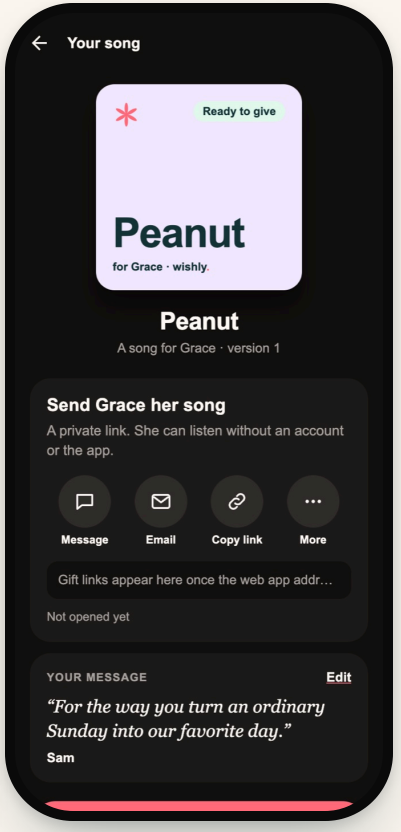

Listen and check

Three checks, lyrics, and "Fix something" for one correction.

Add a message

Shown to them just before the song. Creates the gift link.

Ready to give

Share by text, email or link, and see if it's been opened.

Demo button

"Finish the song now (demo)" stands in for the real song pipeline, which still needs to be built.

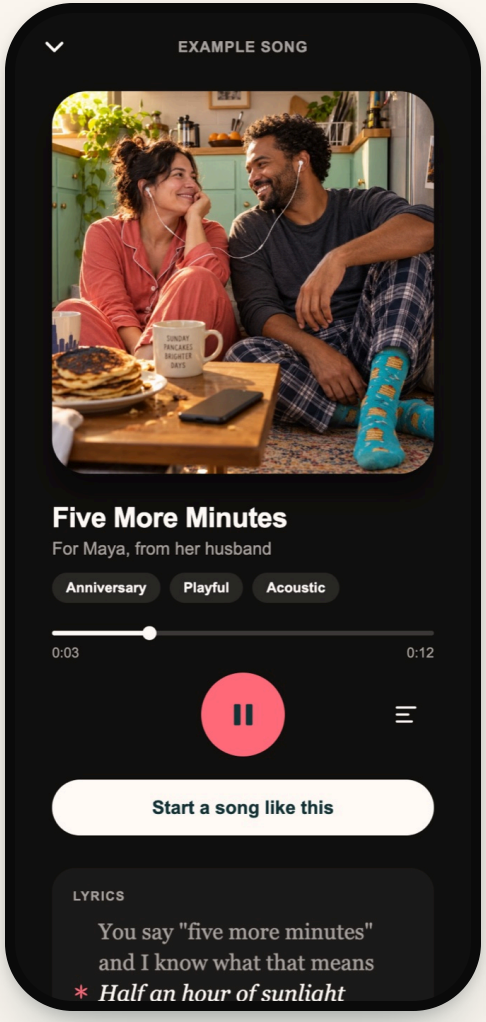

04 · THE APP

Listening and My songs

It should feel like a music app. Every song has cover art, and one player follows you around.

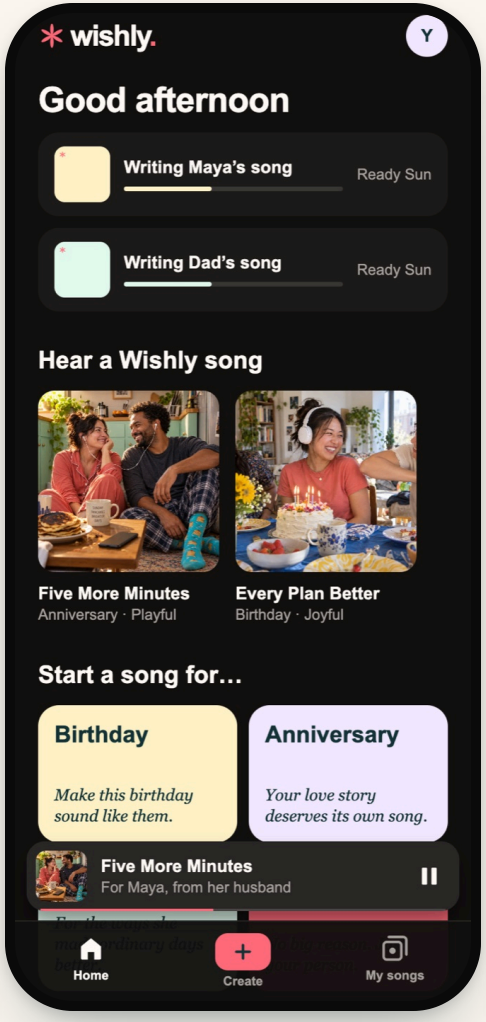

Covers from the name

Each cover is made from the person's name or nickname, in the occasion's colour. The photos are only on the example songs.

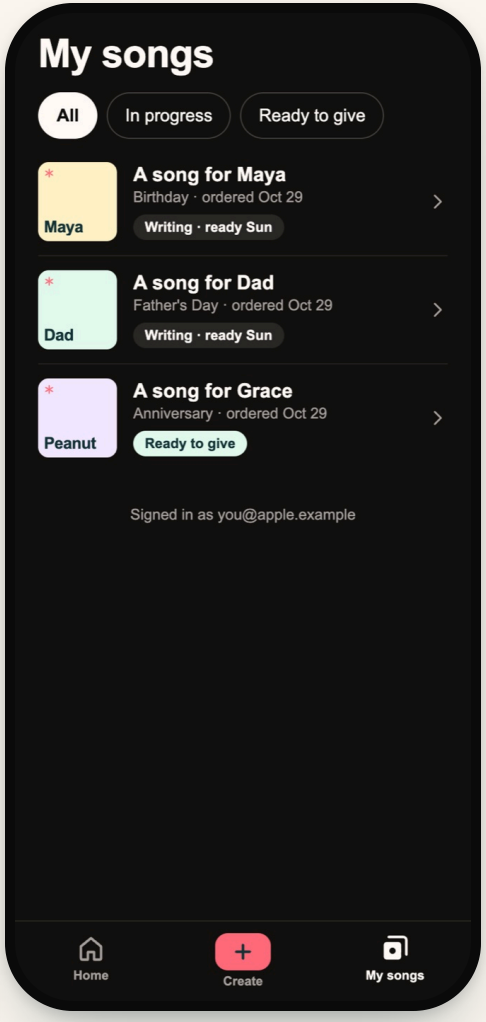

Now playing

Big cover, scrubber, and lyrics that follow along. Grows out of whatever was tapped.

Mini player

Sits above the tab bar on every tab while something plays.

My songs

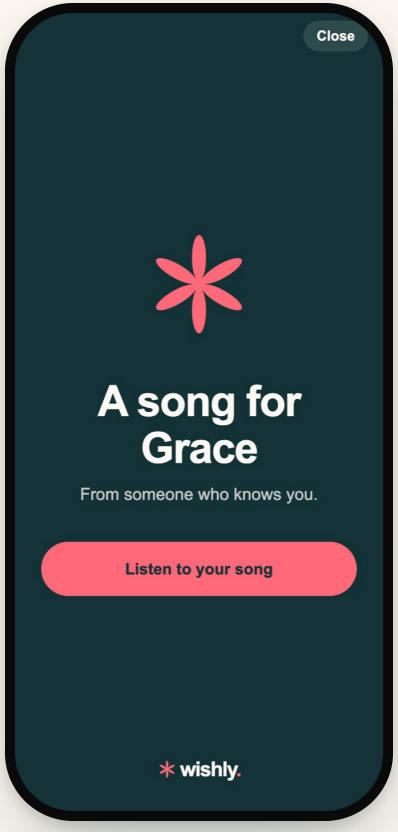

Every song with its cover and status, filtered by in progress or ready to give.

05 · THE PERSON RECEIVING IT

What they see

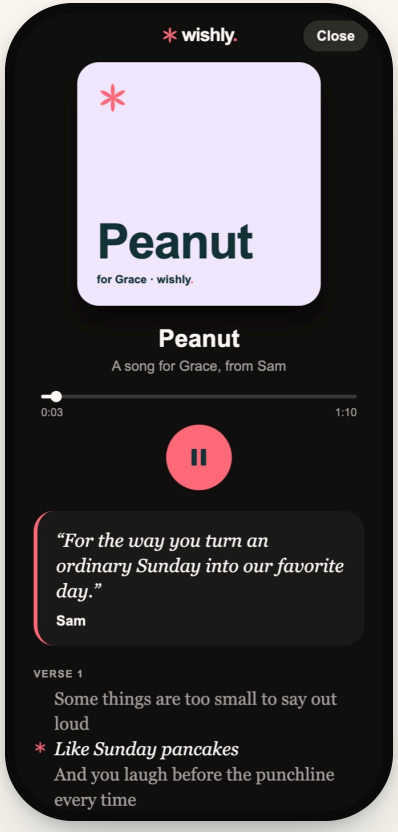

The gift opens on the web from a private link. The buyer can preview it in the app first.

PREVIEW IN THE IPHONE APP

Gift cover

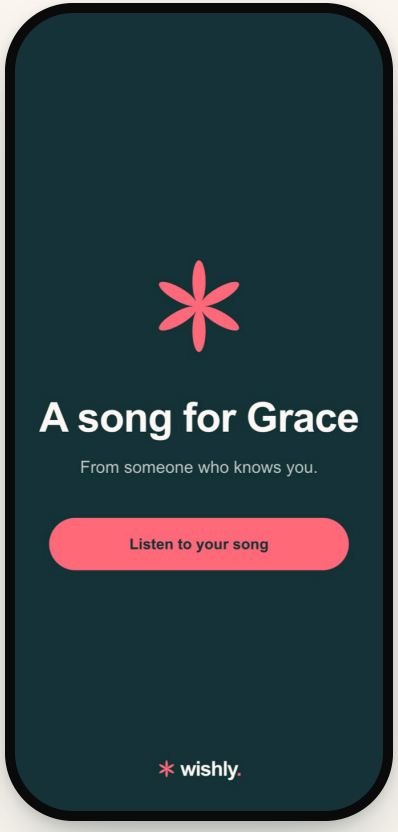

Their name and one button.

Opened

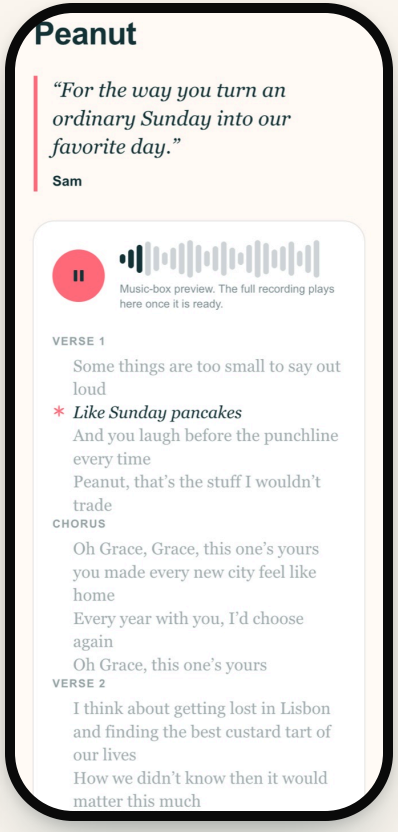

The song, the message, the lyrics.

WHAT THEY ACTUALLY OPEN · WEB

Gift cover

No app, no account.

Opened

Earlier light design.

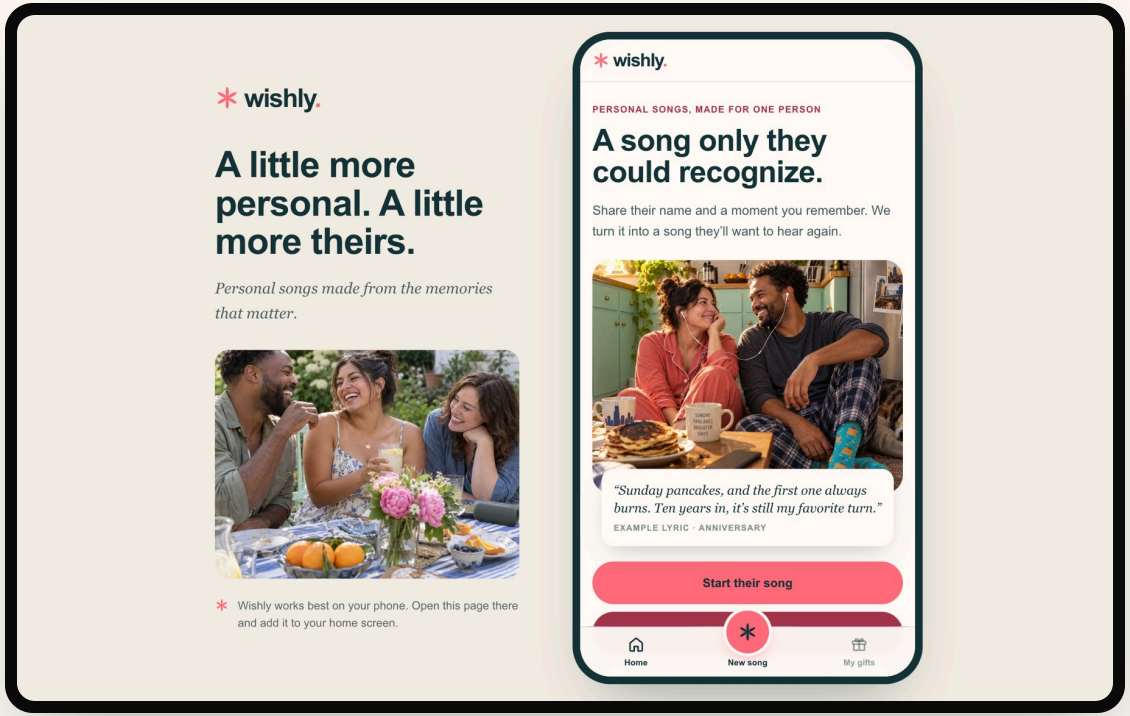

Two looks to bring together

The opened gift on the web still uses the earlier light design. The app's preview shows the current dark design.

06 · THE WEB APP

The web app’s main job is the gift page

Recipients open their song at `/gift/…` on the web. This app also holds the first version of the buying flow, in the earlier light design, from before the iPhone app.

On a laptop

The site shows itself as a phone and suggests opening it on one.

On a phone

The web home page and buying flow.

Open question

Should people also be able to buy on the web? If yes, restyle this flow to match the app. If not, cut it down to the gift page.

Two apps, one backend to connect.

THE PRODUCT

iPhone app

`wishly-ios/`

Expo SDK 58, React Native, Expo Router, Reanimated 4, TypeScript

orders and sign-in →

THE BACKEND

Base44

One shared **Order** record, accounts, backend functions. Not connected yet.

← gift by its private link

FOR RECIPIENTS

Web app

`wishly/`

React, Vite, Tailwind. The gift page at `/gift/…`

TO BUILD

Song pipeline

Lyrics, vocals and recording on the server. Sets the song's audio, which replaces the music box.

TO CHOOSE

Payments

Stripe or Apple in-app purchase, once Apple's rules for digital goods are checked.

TO BUILD

Notifications

The app asks permission. Sending "your song is ready" isn't built.

AN ORDER'S LIFE

Writing → **Ready to listen and check** → **Making a correction** (once, optional) → **Ready to give**

WHAT'S IN THE REPOSITORY

```
wishly-app/
├─ CLAUDE.md        read first
├─ wishly-ios/      the iPhone app
│  ├─ src/app/      every screen
│  ├─ src/lib/      catalog, player,
│  │                motion, songwriter
│  ├─ src/api/      Base44 + demo store
│  └─ base44/       the Order schema
└─ wishly/          the web app
   └─ src/pages/    Gift, Home, Create…
```

Settings such as the Base44 app ID go in `wishly-ios/.env.local`, which is never committed. `.env.example` lists them.

A dark music app on a warm near-black.

Suno was the reference. Covers and coral buttons stand out against the dark. The colours and type come from the Wishly brand book.

#121110
Background

#1E1C1B
Cards and sheets

#FFFAF5
Text, warm ivory

#FF6B7A
Coral, for actions

#143438
Teal, brand moments and text on coral

#F2E8FF
Lilac: love, looking back

#FFF2C7
Butter: celebrations, play

#E1FAED
Mint: family, gentle moments

Arial Bold
The practical voice: titles, buttons, labels.

Georgia Italic
The emotional accent: lyrics, quotes, messages.

- **Motion feels like iOS.** Spring animations throughout: the cover grows into the player, ticks land with a bounce, sparks burst when a song is ready.
- **Reduce Motion is respected.** Movement becomes short fades and looping effects stop.
- **Liquid Glass** on iOS 26 and later for the tab bar, mini player and header.
- **Gentle occasions stay gentle.** Remembrance songs get softer copy and a glow instead of sparks.

Design file: the Claude Design canvas “Wishly App Screens”, iOS page. Ask Neha for access. It hasn’t been updated for the US-only launch, so where it differs from the app, the app wins.

09 · DECISIONS TO KEEP

Already decided. Change them on purpose.

US only, for now

US English, US dollars, US occasions. India and other markets are written and switched off by one setting, `MARKETS`, in each app's catalog file. Leave that content in place.

The buyer checks before it's given

Every song is heard and checked by the buyer first, with one correction round included. This is the promise that makes a personal song safe to buy.

No account wall

Browsing, examples and writing a whole song need no account. Sign-in happens once, when the order is placed.

Recipients never need the app

Gifts open on the web from a private link. The gift page should fetch only that one song through a backend function, so orders are never public.

iPhone first

The iPhone app is the product. Builds go through Expo's cloud service (EAS), so nobody needs Xcode on their own machine.

A music app, not a form

Dark design, cover art for every song, one shared player, motion that feels like iOS. Read the Motion section of the app's README before adding animation.

Next steps, roughly in order.

1

Connect Base44

Create the Base44 project, push the Order schema and put its app ID in both apps. The steps are in `wishly-ios/README.md` under "Connect Base44".

Needs: Base44 access

2

Finish the backend

The gift page's backend function, the real song pipeline (vocals and recording), the gift link address, and payment.

Needs: a song provider and a payment decision

3

First TestFlight build

Run `npx testflight` in `wishly-ios/`. It asks for a bundle ID. Set the app's settings as EAS environment variables first.

Needs: a paid Apple Developer account and Expo access

4

Test on a real iPhone

Above all, the Apple and Google sign-in round trip back into the app. Also haptics, Liquid Glass, notifications and the feel of the motion.

5

Replace the photos

The photos in the app and on the web are illustrative, from the brand kit. Swap in licensed photography before launch.

6

Later

Other markets: add them to `MARKETS`. Also decide whether the web keeps a buying flow, and bring the web gift page into the dark design.

Up and running in ten minutes.

```
# get the code
git clone https://github.com/nehahypergro/wishly-app
cd wishly-app/wishly-ios
npm install

# run the iPhone app in a browser…
npm run web
# …or on your iPhone with the Expo Go app
npx expo start
```

- **Working with Claude?** Open the `wishly-app` folder in Claude Code. It reads `CLAUDE.md` on its own, which covers all of this in more detail.
- **Before calling anything done,** run the checks listed in `CLAUDE.md`.
- **To see the first launch again,** clear the site's data in the browser, or delete the app from the phone.

ASK NEHA FOR

- The Wishly Product Brief and the brand kit
- Access to the design canvas, "Wishly App Screens"
- Access to the Base44 app. There's also a private **wishly** repository on GitHub with an existing Base44 app: ask whether that's the backend to use
- Access to the Expo account
- Access to the Apple Developer and App Store Connect team
- A decision on payments and who makes the songs

wishly.

A song only they could recognize.
